

Synthetic Evaluation of a Structured Imaging Workflow

Classroom Education Team | Synthetic Journal of Imaging Education | 2026. This article and all results were created solely to test educational software.

Abstract

Purpose: demonstrate how an imaging journal can be converted into a teaching presentation. Methods: 120 fictional examinations were reviewed with two imaginary workflows. Results: all numerical values are invented. Conclusion: this file is useful for software validation and must never be interpreted as evidence for medical decisions.

Introduction

A reusable classroom example must avoid copyrighted articles and identifiable patient data. This synthetic document includes searchable text, a raster workflow figure, and a vector table so students can verify extraction, image post-processing, and PowerPoint creation.

Methods

The simulated cohort contains 120 invented cases. Three fictional readers apply a structured checklist. The reference standard, outcomes, and all confidence estimates are fabricated. No human participants, protected health information, or real imaging datasets are included.

Study design: synthetic classroom simulation

Results

The diagram illustrates the imaginary transition from image acquisition to structured review and a fictional teaching outcome. All percentages are placeholders for pipeline validation.

Figure 1. Synthetic image-review workflow with fictional sensitivity and specificity. This figure is generated for the classroom and contains no patient images.

Imaging Interpretation

Students should explain the workflow rather than treat its performance values as scientific findings. A figure should remain on one slide and retain all labels and arrows.

Comparative Performance

Table 1 compares two fully fictional workflows. The vector table is intentionally included to test text-based table extraction and safe image padding.

Table 1. Synthetic workflow comparison

Synthetic measure	Workflow A	Workflow B	Difference
Sensitivity	88%	76%	+12 points
Specificity	82%	79%	+3 points
Median review time	4.2 min	5.1 min	-0.9 min
Reader agreement	0.74	0.61	+0.13

Discussion

This synthetic resource supports repeatable testing on macOS, Windows, and continuous integration environments. It demonstrates document structure and figure placement without distributing copyrighted journal content.

Limitations

The article has no real participants, no validated reference standard, no institutional review, and no scientific conclusions. Its sole intended use is software validation.

Conclusion

A portable teaching repository can demonstrate medical-journal presentation generation without exposing protected information. Every result in this document is fictional.
